FOR IMMEDIATE RELEASE:

New *Comotiv*TM Systems CEO leads company with state-of-the-art platform, new offices

(Portland, Ore. – Oct. 26, 2005) Technology is showing new signs of life.

According to an American Electronics Association (AeA) study, the technology sector has added nearly 190,000 jobs, a 3.4 percent increase between January 2004 and June 2005. This is great news for Portland-based companies like *Comotiv* Systems, because software services account for the second highest number of new jobs.

CEO Ken Majors took control of *Comotiv* Systems' reins last year. In this time, Majors has not only moved the company to a larger professional space in downtown Portland's Columbia Building, but he has led the company to produce an extremely viable, state-of-the-art collaboration product.

"*Comotiv* Systems is producing a high-end, cost-effective product and we are thrilled with the results," Majors said. "Our business partners are seeing their investment take root with a 200 percent increase in revenue in six short months. This leading-edge, one-of-a-kind collaborative technology saves time, money and resources across all industries – from health and emergency services to education and government agencies."

The company's clients not only cross industries but the country as well. One of its local clients includes Oregon Health Sciences University (OHSU), which has saved about \$150,000 in operating and travel costs after utilizing *Comotiv Collaboration Workspace*. The company also services financial institutions, such as the First Arkansas Valley Bank.

Comotiv CollaborationTM is a web-based system that provides a comprehensive suite of collaboration tools for a flat service fee. The *Comotiv* Collaboration suite includes multicast, multi-point video; audio conferencing; and extensive project management tools.

Comotiv Systems' 21-person staff is headquartered at the Columbia Building, 111 S.W. Columbia St., Suite 950, in Portland. Founded in 1999, *Comotiv*'s easy-to-use product is an application service provider (ASP)-based solution providing a central communication repository through a highly secure web interface.
